Investor proposal

A simple view of what the investor pays and what they may receive

The Skinny

Investor pays	Investor receives
$1,000 per month for up to 12 months. Maximum contribution: $12,000.	10% of eligible customer payments actually collected, after refunds, chargebacks, and sales tax.
100% of contributions fund third-party AI model usage.	Calculated and paid every three months with a matching revenue report.
Unspent contribution money is returned when funding ends.	Payments stop at 1.5 times total contributions, or 3 years after the last contribution, whichever comes first.

Where the money goes

Contributions pay for third-party text, coding, image, audio, and video model usage. Labor, marketing, equipment, and general overhead are paid separately by Commission Labs.

What we build and sell

We identify a company's pain points and create tailored solutions. Other offerings may include web design, web applications, PWAs, video editing, UGC, logos, animation, games, and 3D design. The signed agreement will list which offerings count for the investor's revenue share.

How a payment works

If customers pay $15,000 for eligible work during a quarter and $1,000 is refunded, eligible collected revenue is $14,000. The investor receives 10% of that amount, or $1,400. The payment comes from customer receipts, not from the investor's contribution.

When payments end

If the investor contributes the full $12,000, the maximum total payout is $18,000. The share also ends 3 years after the final monthly contribution, even if the investor has received less than $18,000. For example, a final contribution on December 1, 2027 means customer receipts through December 1, 2030 may count, unless the payout cap is reached first.

Main risks

Customer sales may be low or zero. AI usage can be spent without producing a sale. Model cost, quality, access, licensing, and competition can change. There is no guaranteed repayment or return; the investor could lose the entire contribution.
